Search Notes

Dear Examiner Mitra,

Here are the results of your search.

Please feel free to contact me if you have any questions.

Toby Port

STIC SEARCH RESULTS FEEDBACK FORM

Biotech-Chem Library

Questions about the scope or the results of the search? Contact the searcher or contact:

Mary Hale, Information Branch Supervisor Remsen Bldg. 01 D86 571-272-2507

Voluntary Results Feedback Form

~	I am an examiner in Workgroup: Example: 1610
>.	Relevant prior art found, search results used as follows:
	☐ 102 rejection
	☐ 103 rejection
	Cited as being of interest.
	Helped examiner better understand the invention.
	Helped examiner better understand the state of the art in their technology.
	Types of relevant prior art found:
	☐ Foreign Patent(s)
	 Non-Patent Literature (journal articles, conference proceedings, new product announcements etc.)
>	Relevant prior art not found:
	Results verified the lack of relevant prior art (helped determine patentability).
	Results were not useful in determining patentability or understanding the invention.
Со	mments:

Drop off or send completed forms to STIC-Biotech-Chem Library Remsen Bldg.

AΒ In Staphylococcus aureus, the agr locus is responsible for controlling virulence gene expression via quorum sensing. As the blockade of quorum sensing offers a novel strategy for attenuating infection, we sought to gain novel insights into the structure, activity and turnover of the secreted staphylococcal autoinducing peptide (AIP) signal molecules. A series of analogues (including the L-alanine and D-amino acid scanned peptides) was synthesized to determine the functionally critical residues within the S. aureus group I AIP. As a consequence, we established that (i) the group I AIP is inactivated in culture supernatants by the formation of the corresponding methionyl sulphoxide; and (ii) the group I AIP lactam analogue retains the capacity to activate agr, suggesting that covalent modification of the AgrC receptor is not a necessary prerequisite for agr activation. Although each of the D-amino acid scanned AIP analogues retained activity, replacement of the endocyclic amino acid residue (aspartate) located C-terminally to the central cysteine with alanine converted the group I AIP from an activator to a potent inhibitor. The screening of clinical S. aureus isolates for novel AIP groups revealed a variant that differed from the group I AIP by a single amino acid residue (aspartate to tyrosine) in the same position defined as critical by alanine scanning. Although this AIP inhibits group I S. aureus strains, the producer strains possess a functional agr locus dependent on the endogenous peptide and, as such, constitute a fourth S. aureus AIP pheromone group (group IV). The addition of exogenous synthetic AIPs to S. aureus inhibited the production of toxic shock syndrome toxin (TSST-1) and enterotoxin C3, confirming the potential of quorum-sensing blockade as a therapeutic strategy.

The synthesis of virulence factors and other extracellular proteins AB responsible for pathogenicity in Staphylococcus aureus is under the control of the agr locus. A secreted agr-encoded peptide, AgrD, processed from the AgrD gene product, is known to be an effector of self-strain activation and cross-strain inhibition of the agr response. Biochemical analysis of AgrD peptides isolated from culture supernatants has suggested that they contain an unusual thiol ester-linked cyclic structure. In the present work, chemical synthesis is used to confirm that the mature AgrD peptides contain a thiolactone structure and that this feature is absolutely necessary for full biological activity. The AgrD synthetic thiolactone peptides exhibited biological activity in vivo in a mouse protection test. Structure-activity studies have allowed key aspects of the peptide structure involved in the differential activation and inhibition functions to be identified. Accordingly, we propose a model for activation and inhibition of the agr

AB We previously determined that all 6 Staphylococcus aureus strains with confirmed intermediate-level resistance to glycopeptides (glycopeptide intermediate S. aureus [GISA]) from the United States that we tested belonged to accessory gene regulator (
agr) group II. In the present study, we found that 56% of surveyed bloodstream methicillin-resistant S. aureus isolates (n = 148) at

our hospital were $\operatorname{\mathbf{agr}}$ group II, whereas only 24% of methicillin-susceptible S. aureus isolates (n = 33) were $\operatorname{\mathbf{agr}}$ group II (P = .001). Population analysis of genetically engineered $\operatorname{\mathbf{agr}}$ -null and parent wild-type strains of groups I, II, and IV

revealed that, when agr function is lost, the agr group II knockout S. aureus was most likely to develop glycopeptide

heteroresistance after growth in 1 microg/mL but not 16 microg/mL vancomycin. This strain was unique in showing decreased autolysis after growth in these conditions. This study suggests that some S. aureus strains have an intrinsic survival advantage under a glycopeptide selective pressure, which is possibly related to reduced autolysis after exposure to subinhibitory concentrations of glycopeptide.

Aspirin has been previously shown to reduce the in vivo virulence of Staphylococcus aureus in experimental endocarditis, through antiplatelet and antimicrobial mechanisms. In the present study, salicylic acid, the major in vivo metabolite of aspirin, mitigated two important virulence phenotypes in both clinical and laboratory S. aureus strains: alpha-hemolysin secretion and fibronectin binding in vitro. In addition, salicylic acid reduced the expression of the alpha-hemolysin gene promoter, hla, and the fibronectin gene promoter, fnbA. Transcriptional analysis, fluorometry, and flow cytometry revealed evidence of salicylic acid-mediated activation of the stress-response gene sigB. Expression of the sigB-repressible global regulon sarA and the global regulon agr were also mitigated by salicylic acid, corresponding to the

reduced expression of the hla and fnbA genes in vitro. Studies in experimental endocarditis confirmed the key roles of both sarA and sigB in mediating the antistaphylococcal effects of salicylic acid in vivo. Therefore, aspirin has the potential to be an adjuvant therapeutic agent against endovascular infections that result from S. aureus, by downmodulating key staphylococcal global regulons and structural genes in vivo, thus abrogating relevant virulence phenotypes.

AB It has long been known that certain antibiotics, at subinhibitory concentrations, differentially inhibit the synthesis of alpha-hemolysin and other staphylococcal virulence factors. In this report, we show that subinhibitory clindamycin (SBCL) eliminates production of nearly all exoproteins by Staphylococcus aureus but has virtually no effect on cytoplasmic proteins. The effect was abolished by a gene conferring resistance to macrolides-lincosamides-streptogramin B, showing that differential inhibition of protein synthesis is responsible; remarkably, however, subinhibitory clindamycin blocked production of several of the individual exoprotein genes, including spa (encoding protein A), hla (encoding alpha-hemolysin), and spr (encoding serine protease), at the level of transcription, suggesting that the primary effect must be differential inhibition of the synthesis of one or more regulatory proteins. In contrast to earlier reports, however, we found that subinhibitory clindamycin stimulates synthesis of coagulase and fibronectin binding protein B, also at the level of transcription. agr and sar expression was minimally affected by subinhibitory clindamycin. These effects varied from strain to strain and do not seem to be responsible for the effects of subinhibitory clindamycin on the overall exoprotein pattern.

AB Cross-inhibition by quorum-sensing pheromones between Staphylococcus aureus and Staphylococcus epidermidis was investigated using all known S. aureus agr pheromone subgroups. All S. aureus subgroups were sensitive towards the S. epidermidis pheromone, with the exception of the recently identified subgroup 4. The subgroup 4 pheromone was also the only S. aureus pheromone able to inhibit the S. epidermidis agr response. The close relation of subgroup 4 to subgroup 1 suggests that subgroup 4 might have evolved from subgroup 1 by mutation under the selective pressure of competition with S. epidermidis. The competition between S. aureus and S. epidermidis by means of quorum-sensing cross talk seems to be generally in favor of S. epidermidis, which might explain the predominance of S. epidermidis on the skin and in infections on indwelling medical devices.

AB The accessory gene regulator (agr)

system of staphylococci regulates the expression of virulence factors in response to cell density. The extracellular signaling molecule encoded by this system is a thiolactone-containing pheromone peptide whose primary sequence varies among staphylococcal strains. A post-translational modification of the peptide is believed to be carried out by an enzyme with a novel function, AgrB. Staphylococcal pheromones show cross-inhibiting properties: Pheromones of self and pheromones of non-self induce and suppress the agr response, respectively, and have therefore been proposed as novel anti-staphylococcal drugs. As inhibition of agr leads to diminished expression of toxins, but to increased expression of colonization factors and biofilm formation, their therapeutic potential remains yet to be evaluated in depth.

AΒ Two-component signaling systems involving receptor-histidine kinases are ubiquitous in bacteria and have been found in yeast and plants. These systems provide the major means by which bacteria communicate with each other and the outside world. Remarkably, very little is known concerning the extracellular ligands that presumably bind to receptor-histidine kinases to initiate signaling. The two-component agr signaling circuit in Staphylococcus aureus is one system where the ligands are known in chemical detail, thus opening the door for detailed structure-activity relationship studies. These ligands are short (8- to 9-aa) peptides containing a thiolactone structure, in which the alpha-carboxyl group of the C-terminal amino acid is linked to the sulfhydryl group of a cysteine, which is always the fifth amino acid from the C terminus of the peptide. One unique aspect of the agr system is that peptides that activate virulence expression in one group of S. aureus strains also inhibit virulence expression in other groups of S. aureus strains. Herein, it is demonstrated by switching the receptor-histidine kinase, AgrC, between strains of different agr specificity types, that intragroup activation and intergroup inhibition are both mediated by the same group-specific receptors. These results have facilitated the development of a global inhibitor of virulence in S. aureus, which consists of a truncated version of one of the naturally occurring thiolactone peptides.

The virulence of Staphylococcus aureus is controlled by the AΒ

accessory gene regulator (agr)

system, including an extracellular inducer encoded by agrD. Variable agr PCR restriction fragment length polymorphism (RFLP) patterns of unique S. aureus strains (n = 192) were determined for a region comprising agrD and parts of the neighboring agrC and agrB genes. Twelve unique RFLP patterns were identified among S. aureus strains in general; these patterns were further specified by sequencing. All sequences could be catalogued in the three current agr groups. A major proportion of the S. aureus strains belong to agr group 1, whereas only 6% of the methicillin-susceptible S. aureus strains and 5% of the methicillin-resistant S. aureus strains belong to agr groups 2 and 3, respectively. The homology between groups varied from 75 to 80%, and within groups it varied from 96 to 100%. Different levels of sequence variability were observed in the different agr genes. agr-related bacterial interference among colonizing S. aureus strains in the noses of persistent and intermittent human carriers was studied. S. aureus strains belonging to different agr groups were encountered in the same individual. This may suggest that the activity of the agrD gene product does not define colonization dynamics, which is further substantiated by the rarity of agr group 2 and 3 strains.

PRIORITY APPLN. INFO.:
    The invention relates to antibacterial amide macrocycles, e.g. (I), to
    methods for the production thereof, and to the use of the same for producing
    pharmaceuticals for the treatment and/or prophylaxis of illness, especially
    bacterial infections. Title compds. were synthesized beginning with
     salicylaldehyde, which was 5-iodinated, O-protected, reduced to the
    hydroxymethyl, brominated on the CH2 group, and coupled with di-Et
     2-tert-butoxycarbonylaminomalonate, which, after decarboxylation and
    deesterification, gave the (DL)-N-Boc-protected 2'-benzyloxy-5'-iodo-
    phenylalanine (II). II was resolved into its pure D- and L-enantiomers;
     the L-II was protected as the N-Cbz derivative, then esterified with
     2-(trimethylsilyl)ethanol, then reacted with (III) (prepared from II and
     4,4,4',4',5,5,5',5'-octamethyl-2,2'-bi-1,3,2-dioxaborolane) to give
    biphenyl compound (IV). In a sep. reaction, (V) was prepared from the
    corresponding L-ornithine tert-Bu ester, the lactone opened and the alc.
    protected as the tert-butyldimethylsilyl derivative, and reacted with biphenyl
    IV, to give, after deprotection and amide formation, I as the
    dihydrochloride salt. In in vitro tests, using S. aureus, E. faecalis, B.
    catarrhalis, and E. coli strains, I had min. blood concentration effective ranges
    of 0.2-6.25 \mu M.

    The expression of many staphylococcal virulence factors are regulated by
     the agr locus via a two-component signal transduction system
     (TCSTS), which is activated in response to a secreted autoinducer peptide
     (AIP). By exploiting the unique chemical architecture of the naturally
     occurring AIP-1, several potent inhibitors of staphylococcal TCSTS were
     designed and synthesized using either a linear or branched solid-phase
     approach. These prepared inhibitors I [R1 = CH(NH2)(S)-CH24-C6H4OH, R2 =
     Me, or CH2Me; R1 = (CH2)3OC6H4CH2Ph, or (CH2)3OC6H4COPh, R2 = Me] are
     competitive binders and contain the crucial 16-membered side-chain-to-tail

We found an increased abundance of pbpB-specific transcripts in vancomycin intermediate-resistant Staphylococcus aureus (VISA) isolates compared with that found in paired, genetically identical, susceptible isolates. This difference in expression cannot be explained by differences in the pbpB promoter sequence. Since the factors controlling pbpB gene expression have remained largely unexplored, various conditions that might affect VISA strains, pbpB expression varied with the growth phase, with the highest abundance of pbpB-specific transcripts detected during mid-log phase. Interestingly, both vancomycin and oxacillin were able to induce pbpB transcription above a constitutive level. When vancomycin was absent, one of the three pbpB-specific transcripts that were usually faintly detected in non-VISA strains was more readily detected in VISA strains during mid-log but not stationary phase. This transcript was enhanced in non-VISA strains by vancomycin induction. Gel shift assays indicated that an increased amount of the putative transcription factor that binds to both P1 and P1' promoter regions is present in the cytosol of vancomycin-induced cells. Neither the SigB sigma factor nor the quorum-sensing agr locus was required for growth phase-variable pbpB expression or transcriptional induction of pbpB by vancomycin or oxacillin. Also, MecI, MecRl, BlaI, and BlaRl, regulatory proteins that mediate β - lactam-inducible expression of mecA and β -lactamase, were not required for antibiotic induction of pbpB transcription. These data support the idea that pbpB expression is modulated by a trans-acting factor in response to the presence of the cell

The invention provides antimicrobial agents and compns. that include AR cyclic peptides having an amino sequence of alternating D-and $L-\alpha$ -amino acids. Alternatively, the cyclic peptides are made from β -amino acids. Methods for identifying and evaluating antimicrobial cyclic peptides are also provided.

     The present invention provides methods for identifying new drugs and
     potential inhibitors and modulators of drug-resistant variants of a target
     protein of a drug of interest. A drug-resistant variant according to the
     invention has at least one mutation resulting in a structural change, an
     activity change or a stability change as compared to the target protein.
     Such variants would include natural variants such as those encountered in
     the clinic, but preferably variants are selected by directed evolution
     methodol. The present invention relates to methods for designing new
     drugs useful against drug-resistant bacterial cells, viruses, mammalian
     cells and the like. The method involves identifying a target protein of the drug, selecting for drug-resistant variants that have an altered
     target protein (variant protein) by directed evolution, determining the three
     dimensional structure of the target and variant proteins and designing a
     new drug that can be effective against at least one drug-resistant
     variant. The present invention can be used to predict future mutations
     that lead to drug resistance and the type of drugs that are effective to
     combat such resistance.

The present invention comprises compns. and methods for treating a tumor or neoplastic disease in a host, The methods employ conjugates comprising superantigen polypeptides, nucleic acids with other structures that preferentially bind to tumor cells and are capable of inducing apoptosis. Also provided are superantigen-glycolipid conjugates and vesicles that are loaded onto antigen presenting cells to activate both T cells and NKT cells. Cell-based vaccines comprise tumor cells engineered to express a superantigen along with glycolipids products which, when expressed, render the cells capable of eliciting an effective anti-tumor immune response in a mammal into which these cells are introduced. Included among these compns. are tumor cells, hybrid cells of tumor cells and accessory cells, preferably dendritic cells. Also provided are tumoricidal T cells and NKT cells devoid of inhibitory receptors or inhibitory signaling motifs which are hyperresponsive to the the above compns. and lipid-based tumor associated antigens that can be administered for adoptive immunotherapy of cancer and infectious diseases.

    Nocathiacin I, I [R = NHC(:CH2)CONH2], and nocathiacin IV, I (R = NH2),
     are novel indole-containing thiazolyl cyclic peptide antibiotics, which
     exhibit potent activity against key Gram-pos. bacterial pathogens,
     including multi drug-resistant Staphylococcus aureus, Streptococcus
     pneumoniae, and Enterococcus faecium. New nocathiacins I (R =
     NHCH2CH2NR1R2; NR1R2 = morpholine; R1 = R2 = CH2CH2OH; R1 = Et, R2 =
     CH2CH2OH; R1 = Me, R2 = CH2CH2OH; R1 = R2 = Et; R1 = Et, R2 = CH2CO2H)
     were prepared from nocathiacin IV by condensation with glycolaldehyde dimer
     followed by tandem reductive amination of the intermediate with NHR1R2.
     This transformation readily tolerated the complex architecture of
     nocathiacin IV and allowed selective incorporation of water-solubilizing
     groups to the primary amide in nocathiacin IV without needing the presence
     of protecting groups.

The synthesis and biol. evaluation of a set of residue 3 analogs of

vancomycin and its aglycon are described. These investigations follow from the promising biol. activity of a protected and synthetically modified vancomycin aglycon analog in which the asparagine side chain was modified to possess a nitrile, rather than a carboxamide. Although this modification typically was detrimental to antimicrobial activity, hydrophobic vancomycin aglycon analogs that lack a lipid anchor as well as the disaccharide are detailed that exhibit unusual potency against VanB, but not VanA, resistant bacteria.

AB Pseudodestruxins A (I) and B (II), two new cyclic peptides, have been isolated from cultures of the coprophilous fungus Nigrosabulum globosum. The structure of pseudodestruxin A was elucidated using 2D NMR techniques and confirmed by single-crystal X-ray diffraction anal. The structure of pseudodestruxin B was assigned by comparing its NMR and FABMS data with those of pseudodestruxin A. The known compds. ascochlorin and 5-chlorocollectorin B were also isolated from N. globosum. Although Pseudodestruxins A and B display antibacterial effects, ascochlorin was found to be responsible for the antifungal activity of the crude extract

PRIORITY APPLN. INFO.: WO 1997-US19557 The present invention provides cyclic peptides I [m = 0-2, n = 0-1, withthe proviso that when m = 2, n = 0; X21, X22, X24, X25, X27, X28 are each independently present or absent; X7 and X4 are either both present or both absent; X8 and X3 are either both present or both absent; X2-X5, X7, X8, X13, X14, X16-X19, X21, X22, X27, X28 independently = hydrophobic amino acid, hydrophilic amino acid, small amino acid, with provisos (i) when X2 = hydrophobic amino acid, X7, X14, X19, X21, and X28 independently = hydrophobic amino acid or small amino acid and X3, X8, X13, X18, X22 and X27 independently = hydrophilic amino acid or small amino acid and (ii) when X2 = hydrophilic amino acid X7, X14, X19, X21, and X28 independently = hydrophilic amino acid or small amino acid and X3, X8, X13, X18, X22 and X27 independently = hydrophobic amino acid or small amino acid; X23-X26 taken together = loop; Z1, Z6, Z5, Z20 independently = hydrophilic amino acid, small amino acid, cysteine-like amino acid; X9-X12 taken together = β -turn; at least one of X9-X12, X23-X26 = basic amino acid; and

wherein the peptide has net pos. charge at physiol. pH] comprising and amphiphilic antiparallel β -sheet region, a loop region, and a β -turn region having broad spectrum antimicrobial activity. The peptides exhibit improved efficacy, bioavailability and/or serum half-life as compared with non-cyclized analogs. Thus, cystine-containing cyclopeptide II inhibited Pseudomonas aeruginosa with MIC = $8 \mu g/mL$ and methicillin-resistant Staphylococcus aureus with $\dot{\text{MIC}}$ = 2 $\mu\text{g/mL}$ compared to 32 μ g/mL against both bacteria for the uncyclized peptide. In addition, II showed increased activities after 15 min and 120 min relative to the uncyclized peptide.

The invention provides biol. active peptides derived from or corresponding AB to regions of a bactericidal permeability increasing factor (B/PI). The peptides are preferably about 10 to 100 amino acids long and have bactericidal and/or endotoxin neutralizing activity. The peptides can be prepared by automated protein synthesis or by recombinant DNA methods. The peptides are useful in methods to treat and prevent bacterial infection in the body and on surfaces. The peptides are also useful to treat endotoxin shock and have endotoxin neutralizing activity.

Last Updated on STN: 24 Dec 2003

We constructed a peptide consisting of a staphylococcal AgrDl pheromone AB fused to the channel-forming domain of colicin la and named it pheromonicin. This fusion peptide had bactericidal effects against methicillin-sensitive and methicillin-resistant Staphylococcus aureus (MSSA and MRSA, respectively), but not against Staphylococcus epidermidis or Streptococcus pneumoniae.

Growth rates, vital staining and colony forming unit (CFU) counts showed that pheromonicin did not merely suppress growth but killed S. aureus cells. The specificity of pheromonicin was shown by the

absence of bactericidal effects against an accessory

gene regulator (agr) locus knockout of

S. aureus, and a dose-dependent inhibition of the bactericidal effects of pheromonicin by competition with

corresponding free AgrD pheromone. In vivo, all pheromonicin-treated mice survived administration of MRSA that was lethal to controls. No toxicity was detectable in human liver or renal cells in culture, or in livers, kidneys or spleens of pheromonicin-treated mice. The results suggest that these types of chimeric peptides may be of value as antibiotics against specific bacterial infections.

NOVELTY - A purified peptide, which inhibits agr-rnaIII transcription in Staphylococcus aureus, is new. The peptide contains 6-12 amino acids in length and comprises amino acid 28 from the AgrD region of a Staphylococcibacterium, or its analogue.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for:

- (1) a peptide composition comprising the purified peptide cited above and a pharmaceutical carrier; and
- (2) treating or preventing an infection or disease caused by **S. aureus** in a subject comprising administering to the subject the purified peptide.

ACTIVITY - Antibacterial.

No biological data given.

MECHANISM OF ACTION - Virulence Factor Inhibitor.

USE - The purified peptides and compositions are useful for treating or preventing an infection or disease caused by a Staphylococci bacterium. ${\rm Dwg.0/4}$

     NOVELTY - A synthetic cyclic peptide (I), in
     particular a AgrD-autoinducing peptide, where AgrD is a secreted
     agr-encoded peptide, where the agr locus controls the
     synthesis of virulence factor and other extracellular proteins responsible
     for pathogenicity in Staphylococcus aureus, is new.
          DETAILED DESCRIPTION - A synthetic cyclic peptide
     (I) with formula (A) or NH2-X(n)-Z-X(y)-\overline{COOH}, and a cyclic bond between Z
     residue and COOH other than a thioester bond, in particular a
     AgrD-autoinducing peptide, where AgrD is a secreted agr-encoded
     peptide, where the agr locus controls the synthesis of virulence
     factor and other extracellular proteins responsible for pathogenicity in
     Staphylococcus aureus, is new.
          X = an amino acid, its analog, peptidomimetic, or nonamide isostere;
          Z' = synthetic or biosynthetic amino acid;
          R = oxygen, nitrogen, sulfur or carbon;
     n = 0-10; or
     y = 1-10.
```

AΒ

INDEPENDENT CLAIMS are also included for the following:

(1) a pharmaceutical composition (II) comprising (I), and a carrier; and

(2) preparing (I).

ACTIVITY - Antibacterial.

MECHANISM OF ACTION - Inhibitor of Agr response. Synthetic approach was used to prepare AgrD peptides from Staphylococcus aureus group I and group II strains. The biological activity of the synthetic AgrD peptides was assayed using cultured ${\bf S}$. aureus strains containing a beta -lactamase reporter gene fused to agrP3 promoter. This allowed activation or inhibition of the agr response to be monitored spectrophotometrically using a calorimetric beta -lactamase activity assay. As with their naturally derived counterparts, synthetic AgrD peptide was found to activate the agr response only within their own S. aureus class, and inhibit the agr response only in S. aureus strains from the other two classes.

USE - (I) is useful for bacterial interference, especially for treating S. aureus infection in a subject. Dwg.0/3

AB WO 9967286 A UPAB: 20000313

NOVELTY - Cyclic peptides (I) derived from AgrD peptides of Staphylococcus aureus are new.

DETAILED DESCRIPTION - (I) are:

(i) of formula (Ia), or

(ii) (Ib), comprise the sequence NH2-Xn-Z-Xy-COOH with a cyclic bond, other than thioester, between Z and COOH:

 $X = amino \ acid \ (aa)$, aa analog, peptidomimetic or non-amide isostere;

Z = synthetic or natural aa;

R = oxygen, nitrogen or carbon;

n = 0-10;v = 1-10

INDEPENDENT CLAIMS are also included for the following:

(a) composition containing (I) and a carrier; and

(b) method for production of (I).

ACTIVITY - Antibacterial.

MECHANISM OF ACTION - (I) inhibits the agr response (associated with release of virulence factors) of S. aureus. Normally an AgrD peptide is produced by S. aureus that (i) activates the agr response in strains of a single group but (ii) interferes with this response in strains of different groups.

USE - (I) are used to treat infections by S. aureus

ADVANTAGE - (I), which mimic the AgrD peptides but have the thiololactone bond replaced by a different cyclic bond, lack the agr-inducing activity of the native peptide for specific bacterial strains, but retains the inhibitory activity against other strains. (I) can be produced in excellent yield by selective intermolecular cyclization/cleavage reaction of the resin-bound, unprotected, linear analog.

WO 9926968 A UPAB: 20000516

NOVELTY - Cyclic peptides (I), their acid or base addition salts and prodrugs are new.

DETAILED DESCRIPTION - (I) have the formula:

A, B, E and D = residues of natural or synthetic amino acids (aa), optionally substituted;

m = 0-5;

= 1-5; ;

X = sulfur, oxygen or NR3;

R1, R2 and R3 = hydrogen, 1-6C alkyl, acyl or alkoxycarbonyl, or,

where m = 0, R1 and R2 may complete a heterocyclic ring;

each Z = residue as defined for A;

the peptide bonds in (I) are optionally substituted on nitrogen by 1-6C alkyl.

When n = 1, X = sulfur, and R1 = R2 = hydrogen and when:

- (i) ABED = Asp-Phe-Ile-Met respectively, (Z)m is not H-Tyr-Ser-Thr;
- (ii) ABED = Asn-Ala-Tyr-Phe respectively, (Z)m is not H-Asp-Ile;
- (iii) ABED = Asp-Phe-Leu-Leu respectively, (Z)m is not H-Tyr-Ile-Asn;
- (iv) ABED = Ser-Ser-Leu-Phe respectively, (Z)m is not H-Gly-Val-Asn-Ala.

INDEPENDENT CLAIMS are included for the following:

- (1) articles coated and/or impregnated with (I); and
- (2) compounds of formula (II):

where:

- (i) AlBlElD1 = Asp-Phe-Ile-Met respectively, Y is H-Tyr-Ser-Thr;
- (ii) A1B1E1D1 = Asn-Ala-Tyr-Phe respectively, Y is H-Asp-Ile;
- (iii) AlB1E1D1 = Asp-Phe-Leu-Leu respectively, Y is H-Tyr-Ile-Asn; or (iv) AlB1E1D1 = Ser-Ser-Leu-Phe respectively, Y is H-Gly-Val-Asn-Ala. ACTIVITY - Antibacterial.

MECHANISM OF ACTION - (I) are modulators of the agr response; agonists of this response antagonize early stages of virulence, specifically production of cell wall proteins (so are preferred for prophylaxis), while antagonists interfere with the later stages of virulence, specifically secretion of exotoxin (so are preferred for treatment). Staphylococcus aureus KH1187A was grown in nutrient broth containing 1.92 mu g/ml of the peptide ZA78, cyclo(Ac-Cys-Asp-Phe-Ile-Met), then the culture supernatant analyzed by electrophoresis and staining with Coomassie Blue. The band for toxic shock syndrome toxin-1, clearly visible in a control culture grown in absence of ZA78, was not detectable.

USE - (I) and (II) are used to treat or prevent bacterial infections in humans and animals, also for incorporation into medical articles, e.g tampons (to prevent toxic shock syndrome), prostheses and wound dressings. Particularly they are active against staphylococci, specifically

Staphylococcus aureus but also coagulase-negative S.

epidermidis, implicated in infection of medical implants.

ADVANTAGE - Some (I) are active against many different bacterial

strains. Dwg.0/0

19950929

9711690 A UPAB: 19970516 AΒ

Treatment or prophylaxis of a bacterial infection in a mammal, by admin. of a cpd. comprising an inhibitor of a global regulator (IGR) of pathogenesis genes (PG) , is new. Also claimed is a method of treating a bacterial infection by administering an inhibitor of one or more pathogenesis factors modulated by agr, sar, sae or xpr. Also new is a method of screening for an IGR of PG, by determining whether a test cpd. alters the level of activity of that IGR. Also claimed is a method for making an antibacterial agent (ABA), comprising screening for the ABA by measuring the ability of ABA to alter the level of activity of global regulator of PG; and synthesising ABA in sufficient amount for admin. to the patient. Also claimed are pharmaceutical compsns. containing an inhibitor of a global pathogene regulator and a carrier.

USE - The cpds., termed antipathogenics, are of use in both human and veterinary infections. They inhibit the naturally occurring,

Mitra 10/032,950

growth-dependent induction of the P3-driven RNAIII and those downstream virulence factors under its influence. Treatment with the cpds. may have any of the following effects: attenuating host inflammatory response, decreasing load of bacterial toxins, disfavouring colonisation of the host, or aiding clearance of infection by the host, and potentiation of the effect of traditional drugs, either by weakening the bacteria or relocating them to a drug or host factor accessible category.

ADVANTAGE - The method represents a new approach to bacterial infections, in contrast to prior art bactericidal, bacteriostatic, or antibiotic cpds., which either kill the microbes or inhibit their growth. The new method targets bacterial pathogenesis, or virulence factors, reducing or eliminating expression of exoproteins, toxins, or other pathogenic factors, associated with specific genes. Even resistant strains of bacteria, partic. staphylococci, most notably S. aureus, which have developed resistance to methicillin or are multi-drug resistant, can be regulated by the cpds. to alter the course of an infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                   Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        seq

The invention relates to AgrD derived cyclic peptides, a composition containing a peptide and a carrier, and a method for the production of the cyclic peptides. The peptide inhibits the agr response, which is normally associated with the release of virulence factors of Staphylococcus aureus. An AgrD peptide is produced by S. aureus that activates the agr response in strains of a single group, but interferes with this response in strains of different groups. The peptides and composition containing them can be used to treat infections by S. aureus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               á
The present sequence is that of a protected peptide used in an example of the preparation of novel synthetic cyclic peptides of the invention (see AM50899-906). The peptide corresponds to the Staphylococcus aureus AgrDII sequence with a Cys5 to Ser mutation (lactone). It was synthesised on a Wang-resin using an Fmoc N-alpha protection strategy. Following chain assembly the peptide was cleaved from the support and the Ser-5 residue deprotected by treatment with a trifluoroacetic acidianisole:water mixture (90:5:5) for 4 hr. The partially protected peptide-alpha carboxylates were then dissolved in DMF and treated with PyBOP and a catalytic amount of dimethylaminopyridine. Cyclization was complete after 2 hr. The remaining protecting groups were then The cyclic peptide is capable of inhibiting the agr response of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Staphylococcus aureus. The thiololactone structure within native AgrD peptides is required for activation of this response. Replacement of the thiol ester component of the cyclic ring structure with a lactone (as in the present case) or a lactam can destroy agr response activating activity while preserving and enhancing inhibitory activity. The cyclic peptides are useful for bacterial interference, especially for the treatment of S. aureus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AgrD2; agr infection;
The present sequence is that of a novel synthetic AgrD2 linear thioester peptide. The peptide is derived from the cyclic AgrD2 peptide of Staphylococcus aureus group II. AgrD2 is a secreted agr-encoded peptide, where the agr locus controls the synthesis of virulence factor and other extracellular proteins responsible for pathogenicity in S. aureus. The biological activity of the synthetic peptide was assayed using cultured S. aureus strains containing a beta-lactamase reporter gene fused to the agrP3 promoter. This allowed activation or inhibition of the agr present to be monitored spectrophotometrically. Unlike an AgrD2 thiololactone cyclic peptide (see AAMS1001), the present peptide was unable to either activate or inhibit the agr response, even
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ន្តន្តន្តន្តន្ត
멂
                             free acid peptide. The peptide is derived from the cyclic AgrD2 peptide of Staphylococcus aureus group II. AgrD2 is a secreted agr-encoded peptide, where the agr locus controls the synthesis of virulence factor and other extracellular proteins responsible for pathogenicity in S. aureus. The biological activity of the synthetic peptide was assayed using cultured S. aureus strains containing a beta-lactamase reporter gene fused to the agrD3 promoter. This allowed activation or inhibition of the agrD3 promoter. This allowed activation or inhibition of the agrD3 promoter cyclic peptide (see AMM51001), the present peptide was unable to either activate or inhibit the agr response, even was unable to either activate or inhibit the agr response, even considered cyclic peptides (see AMM5009) on and methods for preparing them. The cyclic peptides are useful for infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      when added to cultured cells at uM concentrations. The invention provides claimed cyclic peptides (see AAM50899-906 and AAM50999) and methods for preparing them. The cyclic peptides are useful fiberterial interference, especially for the treatment of S. aureus

The present sequence is that of a novel synthetic AgrD2 lactone cyclic peptide in which residue 5 of the peptide is linked to residue 9 via a lactone bond. The peptide is derived from an AgrD2 peptide of Staphylococcus aureus group II. AgrD2 is a secreted agr-encoded peptide, where the agr locus controls the synthesis of virulence factor and other extracellular proteins responsible for pathogenicity in S. aureus. The biological activity of the synthetic peptide was assayed using cultured S. aureus strains containing a beta-lactamase reporter gene fused to the agrD3 promoter. This allowed activation or inhibition of the agr response to be monitored spectrophotometrically. The lactone AgrD2 peptide inhibited the agr response of group I S. aureus strains without activating the agr response in group I, II or III strains. The invention provides claimed cyclic peptides (see AM50899-906 and AAM5099) and methods for preparing them, especially peptides where the cyclic bond is a lactam or lactone bond. The cyclic peptides are useful for bacterial interference, cespecially for the treatment of S. aureus infection.

                                  The invention relates to the use of autoinducer-2 (AI-2) agonists or antagonists for regulating activity of autoinducer-2 receptor, regulating bacterial growth and pathogenesis. Synegistic antiblotic compositions comprising inhibitors of the quorum-sensing pathway of a microorganism are also provided. Methods using such AI-2 analogues are useful for treating pathogen-associated disease states. The compounds and antibiotic compositions can be used to inhibit bacterial cell growth and/or biofilm formation on a medical device, particularly for promoting growth of skin graft replacements used in the treatment of burns and ulcers. They may also be used to aid wound repair, and to inhibit bacterial cell growth and biofilm formation in or on products or devices used for personal hygiene. The present sequence represents a inhibitor of peptide-mediated

The invention relates to AgrD derived peptides, a composition containing a peptide and a carrier, and a method for the production of the cyclic peptides. The peptide inhibits the agr response, which is normally associated with the release of virulence factors of Staphylococcus aureus. An AgrD peptide is produced by S. aureus that activates the agr response in strains of a single group, but interferes with this response in strains of different groups. The peptides and composition containing them can be used to treat infections by S. aureus.
                                                                                                                                                                                                                                                                                                                                                                                                              New cyclic peptides for

The invention relates to AgrD derived cyclic peptides, a composition containing a peptide and a carrier, and a method for the production of the cyclic peptides. The peptide inhibite the agr response, which is normally associated with the release of virulence factors of staphylococcus aureus. An AgrD peptide is produced by S. aureus that activates the agr response in strains of a single group, but interferes with this response in strains of different groups. The peptides and composition containing them can be used to treat infections by S. aureus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                virulence factor.

The present invention also describes a method for treating Staphylococcus aureus infection comprising the administration of a composition comprising (I). (I) has antibacterial activity, and can used as an agr gene response inhibitor. The peptides are useful for treating S. aureus infections.
                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New cyclic peptides, useful infections -

The cyclic bond is especially a lactam or lactone bond. The thiololactone is especially a lactam or lactone bond. The thiololactone structure within native AgrD peptides is required for activation of the agr response. Elimination of the thiol ester component of the cyclic ring structure can destroy agr response activating activity while preserving and enhancing inhibitory activaty. A claimed method of preparing a cyclic peptide involves: assembling a linear peptide chain on to a solid phase resin support; deprotected peptide with neutral buffer for a time sufficient to constitute the cyclic peptide and cleave the peptide from the support; and recovering the cyclic peptide. The peptide is useful for bacterial interference, especially for the treatment of S. aureus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of a protected peptide used in an example of the preparation of novel synthetic cyclic peptides of the invention (see AMM50899-906). The peptide corresponds to the staphylococcus acreus AgrDII sequence with a Cys5 to diaminopropionic acid (Opr) mutation (lactam). It was synthesised on a Wang-resin using an Fmoc N-alpha protection strategy. Following chain assembly, the peptide was cleaved from the support and the Dpr-5 residue deprotected by treatment with a trifluoroacetic acid:anisole:water mixture (90:55) for 4 hr. The partially protected peptides alpha carboxylates were then dissolved in DMF and treated with PyBOP. Cyclization was complete after 2 hr. The remaining protecting groups were removed by treatment with HF and the peptide purified by HFLC. The cyclic peptide is capable of inhibiting the agr response of Staphylococcus aureus. The thioloactone structure within native AgrD peptides is required for activation of this response. Replacement of the thiol ester component of the cyclic ring structure with a lactam (as in the present case) or a lactone can destroy agr response activating activity while preserving and chancing inhibitory activity. The cyclic peptides are useful for infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                          Š
                                                                                                                                                                                                                                                                                             The present sequence is that of a novel synthetic AgrD2 lactam CC cyclic peptide in which residue 5 of the peptide is linked to residue 9 via a lactam bond. The peptide 1s derived from an AgrD2 peptide of Staphylococcus aureus group II. AgrD2 is a secreted agr-encoded peptide, where the agr locus controls the synthesis of virulence factor and other extracellular proteins responsible for pathogenicity in S. aureus. The biological cativity of the synthetic peptide was assayed using cultured S. aureus strains containing a beta-lactamase reporter gene fused to the agrp3 promoter. This allowed activation or inhibition of the agr response to be monitored spectrophotometrically. The AgrD3 lactam peptide inhibited the agr response in group I S. aureus strains and did not activate the agr response in group I S. aureus strains. The invention provides claimed cyclic peptides (see CAMS0899-906 and AAMS0999) and methods for preparing them, captic peptides are useful for bacterial interference, cespecially for the treatment of S. aureus infection.

Synergistic antiblotic compositions comprising inhibitors of the quorum-sensing pathway of a microorganism are also provided. Methods using such AI-2 analogues are useful for treating pathogen-associated disease states. The compounds and antibiotic compositions can be used to inhibit bacterial cell growth and/or biofilm formation on a medical device, particularly for promoting growth of skin graft replacements used in the treatment of burns and ulcers. They may also be used to aid wound repair, and to inhibit bacterial cell growth and biofilm formation in or on products or devices used for personal hygiene. The present sequence represents a inhibitor of peptide-mediated quorum sensing.

CC This novel peptide sequence (or it's analogue) inhibits agr-rnalII cranscription in Staphylococcus aureus (S. aureus), and is 9 amino acids CC long. The peptide can be added to pharmaceutical compositions to treat CC or prevent infections or diseases caused by S. aureus in animals, and CC especially in humans. They can also be combined with traditional CC antibiotics. S. aureus causes conditions ranging from abscesses (boils CC antibiotics) to life-threatening infections e.g. endocarditis, prevents, osteomyelitis, by secreting injurious proteins, or virulence CC factors. The synthesis of virulence factors is controlled by the agr regulator, which activates transcription of the agr-rnalII gene to produce RNAIII, which induces transcription of the genes encoding the CC virulence factors. The peptides inhibit agr-rnaIII transcription in and therefor virulence factor expression. The peptides can also be used in vitro to prevent Staphlococcus aureus colonisation.
                                                                                                                                                                                                                                                                                                                                            Peptide inhibiting agr-rnalII transcription in \mbox{-} useful to treat S. aureus infection

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score

CATALYTIC ACTIVITY: Protein N-phosphohistidine + histidine + sugar phosphate.

SUBCELLULAR LOCATION: Integral membrane protein.

SIMILARITY: Contains 1 PTS EIIA domain.

SIMILARITY: Contains 1 PTS EIIB domain.

SIMILARITY: Contains 1 PTS EIIB domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: COMPONENT OF THE COPII COAT, THAT COVERS ER-DERIVED VESICLES INVOLVED IN TRANSPORT FROM THE ENDOPLASMIC REFICULUM TO THE GOLGI APPARATUS. COPII ACTS IN THE CYTOPLASM TO PROMOTE THE TRANSPORT OF SECRETORY, PLASMA MEMBRANE, AND VACUCLAR PROTEINS FROM THE ENDOPLASMIC RETICULUM TO THE GOLGI COMPLEX. SUBCURIT: COMPIE IS COMPOSED OF AT LEAST FIVE PROTEINS: THE SEC23/SICCAPERS AND SARI.

SUBCURLULAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: BELONGS TO THE SEC23/SEC24 FAMILY. SEC24 SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            _YEAST

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score
